ABSTRACT OF THE DISCLOSURE

A sheet-shaped medium processing apparatus of the present invention is provided with a pair of arranging members 102a, 102b, and these arranging members 102a, 102b have both arranging function for arranging paper S piled on a tray 12 after being discharged in a discharge direction "a" from a paper discharge roller 3 at only fixed position, and sorting/arranging function for arranging the papers S grouped together at different position in direction (direction perpendicular to paper face) perpendicular to the discharge direction "a" in every copy of grouping together predetermined number of the paper S. For that reason, it is possible to conduct sorting/arranging action by using small drive power and to arrange the paper S in high precision regardless of largeness of piled amount of the paper S on the tray 12.
